

AI Lead Enrichment & Qualification Pipeline

Designed for real estate teams and brokerages, this automation streamlines inbound lead qualification by enriching lead data, scoring each inquiry against business-defined criteria, and routing qualified prospects for immediate follow-up while keeping lower-priority leads organized in a structured pipeline.

Client Problem

Real estate teams and brokerages generate leads from websites, property portals, social media campaigns, and online inquiry forms. However, qualifying these leads is often a manual process that slows down sales operations and increases the risk of missing valuable opportunities.

This creates several operational challenges:

- Agents spend valuable time reviewing low-quality or incomplete inquiries.
- High-intent buyers and sellers are not identified or contacted quickly enough.
- Lead information is often inconsistent, making qualification difficult.
- There is no standardized process to score and prioritize leads based on business-defined criteria.
- Low-priority inquiries continue to consume time that could be spent on higher-value prospects.

As a result, response times increase, follow-ups become inconsistent, and promising opportunities can be delayed or overlooked, reducing overall sales efficiency.

Solution

I designed and built an automated lead enrichment and qualification pipeline in n8n that processes each inbound lead end-to-end.

The workflow:

- Captures incoming leads from a form trigger
- Normalizes raw lead data into a consistent structure
- Enriches lead information through an external API
- Evaluates domain quality, company size, budget, and description depth
- Calculates a lead score using weighted qualification rules
- Routes leads into either a high-value or low-priority branch
- Generates AI-assisted outreach insights for strong leads
- Logs results into Google Sheets for tracking
- Sends Gmail notifications for immediate action

This creates a repeatable sales triage system that can operate continuously without manual intervention.

Workflow Overview

The pipeline is structured as a decision-based automation layer with two clear outcomes.

1. Lead Capture

A Typeform trigger starts the workflow whenever a new lead is submitted.

2. Data Normalization

Incoming values are cleaned and standardized so downstream nodes can process them reliably.

3. Enrichment Layer

The workflow enriches lead data using an external enrichment API, helping identify company context, domain quality, and business relevance.

4. Qualification Engine

Lead quality is evaluated using a scoring model based on factors such as:

- Corporate vs consumer email domain
- Estimated budget
- Company size
- Description richness
- Business fit

5. Scoring and Routing

The workflow assigns a score out of 100 and routes the lead based on a qualification threshold.

6. AI Strategy Generation

For high-value leads, the workflow generates structured outreach guidance using an AI model and output parser.

7. Logging and Notification

Each lead is recorded in Google Sheets, and Gmail alerts are sent to notify the sales owner or team immediately.

High-Value Branch

When a lead crosses the threshold, the workflow:

- classifies it as high priority
- creates a lead summary
- generates a recommended outreach strategy
- logs it in the high-value sheet

- sends a branded Gmail notification

Low-Priority Branch

When a lead falls below the threshold, the workflow:

- classifies it as low priority
 - logs it in the low-priority sheet
 - sends a notification that no immediate outreach is required
-

Technologies Used

- n8n for orchestration and branching logic
 - Typeform for lead capture
 - HTTP Request / API enrichment for external data enrichment
 - JavaScript Code nodes for normalization, scoring, and logic handling
 - AI Chat Model / LLM for outreach strategy generation
 - Output Parser for structured AI responses
 - Google Sheets for lead logging and pipeline visibility
 - Gmail for automated notifications
-

Business Impact

This workflow improves lead handling in four critical ways:

Faster response times

Faster lead response by automatically identifying high-intent buyer and seller inquiries.

Better lead prioritization

Agents spend their time on prospects most likely to convert.

Less manual admin work

Qualification, logging, and notification steps are automated.

Cleaner sales operations

All leads are stored in structured sheets, making follow-up and reporting easier.

In practical terms, this kind of system helps a business turn inbound leads into a managed sales pipeline instead of a messy inbox.

Workflow Architecture

```
{
  "json": {
    "priority": "High",
    "lead_summary": "Emily Carter from Sunset Realty Group is looking to automate lead qualification and prioritize serious home buyers to improve agent response times and increase conversion rates.",
    "pain_points": [
      "Agents manually review every incoming lead before making contact",
      "High-intent buyers are delayed because all leads receive equal priority",
      "Lead information is scattered across multiple platforms, reducing sales efficiency"
    ],
    "recommended_solution": "Deploy an AI-powered Lead Enrichment & Qualification Pipeline that automatically enriches incoming leads, scores buying intent, generates AI-driven sales insights, logs qualified leads into the CRM, and instantly notifies agents of high-value opportunities.",
    "value_proposition": "Reduce lead qualification time from several minutes to under one minute while helping agents focus on prospects most likely to buy, improving response times and maximizing conversion opportunities.",
    "best_outreach_channel": "Phone Call",
    "outreach_strategy": "Emphasize faster lead response and AI-based lead prioritization. Demonstrate how automating qualification allows agents to spend more time closing deals instead of sorting leads.",
    "personalized_opening": "I noticed your team is attracting leads from multiple marketing channels. We help real estate teams automatically identify serious buyers, prioritize them instantly, and notify the right agent without any manual effort.",
    "email_subject": "Help your agents reach serious buyers before your competitors do",
    "call_to_action": "Would you be available for a 20-minute discovery call this week to discuss how AI-powered lead qualification can improve your team's response time and conversion rate?",
    "next_follow_up": "If there's no response within 3 business days, send a LinkedIn follow-up highlighting a case study demonstrating faster lead response and improved qualification accuracy.",
    "estimated_deal_size": "$4,000-$7,500",
    "confidence_score": 97
  }
}
```

Shows the AI-generated sales intelligence report with lead summary, pain points, recommended solution, outreach strategy, estimated deal size, and confidence score.

Lead Logging (Google Sheets)

[illegible]

Shows how qualified leads are automatically logged into Google Sheets with enriched data, priority level, estimated deal size, and other key details for tracking and reporting.

Gmail Alert Notification

Shows the automated Gmail notification sent instantly when a high-priority lead is detected, enabling the sales team to respond quickly with the AI-generated lead insights.

Workflow Highlights

- 14 n8n nodes
- 2 branching paths
- AI-generated qualification report
- Google Sheets logging
- Automated Gmail notifications

Call to Action

If your real estate team or brokerage receives a steady flow of buyer and seller inquiries, I can build a customized lead qualification system that automatically prioritizes your most valuable opportunities and streamlines your sales workflow.

I build automation solutions that help you:

- **Qualify buyer and seller leads automatically**
 - **Prioritize high-value prospects for faster agent follow-up**
 - **Reduce manual lead review and administrative work**
 - **Keep your CRM or Google Sheets organized and up to date**
 - **Ensure promising leads receive timely attention while lower-priority inquiries remain tracked for future nurturing**
-
